

The US Mutual Fund Landscape

2015

Surveying the landscape

This study evaluates a sample of US funds totaling more than 5,200 managers and representing about \$10 trillion in wealth by the end of 2014.

Mutual funds are a popular way to invest, offering shareholders professional management and the convenience of daily pricing, market liquidity, periodic reporting, and access to many investment styles and strategies.

Exhibit 1.1 offers a representative sample of the US mutual fund industry at the end of 2014, showing a category breakdown of US-domiciled equity and fixed income funds in operation. Exhibit 1.2 (next page) graphs the total value of assets under management by category for this sample over the past 15 years. Combined, the figures describe a large and growing industry. By the end of 2014, the sample contained more than 5,200 US-based funds

collectively managing about \$10 trillion in shareholder wealth. Since 2000, assets under management grew more than 213%, and the number of funds increased by 46%.

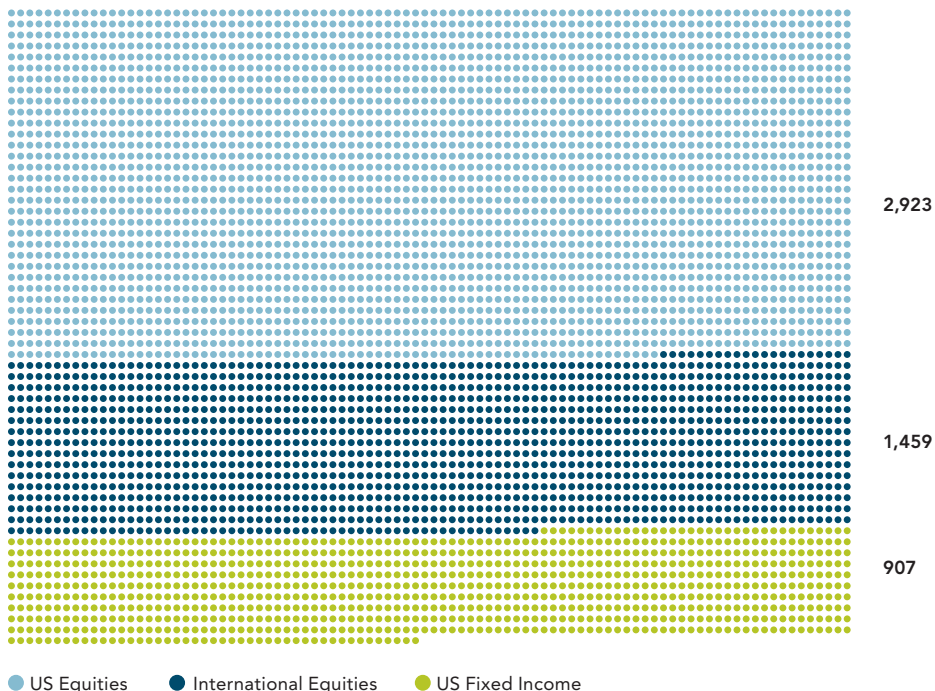

The sheer size of the mutual fund landscape highlights its importance as a primary vehicle to connect investors with the global financial markets, but also illustrates the challenge of fund evaluation and selection. Investors must choose among thousands of funds representing a broad range of manager philosophies, objectives, and styles—all of which contribute to fund performance and, ultimately, to the investor's experience.

2

Number of US-domiciled funds in the sample as of December 31, 2014. International equities include non-US developed and emerging markets funds.

See Data appendix for more information.

Despite a myriad of choices, selecting a successful fund manager is harder than it appears. The research shows that few mutual funds have delivered benchmark-beating returns over time. And although it is easy to find managers with impressive track records, past outperformance is rarely a reliable indicator of future performance.

The main reason is market competition. Each day, the global financial markets process millions of trades worth hundreds of billions of dollars. The buying and selling aggregates vast amounts of dispersed information into prices, driving them toward fair value.

This is good news for long-term investors. Though the price of a stock or bond may not always be perfect, investors can regard that price as the best estimate of actual value. But fair pricing works against fund managers and other market participants who believe they can identify “mispriced” securities and convert their knowledge into higher returns.

With the market’s pricing power at work, fund managers have few opportunities to gain an informational advantage, and most funds that search for mispriced securities face a steep uphill climb.

Let’s consider some of these challenges in more detail.

Exhibit 1.2 Assets under Management

In USD (billions), 2000–2014

A case of disappearing funds

The size and complexity of the mutual fund landscape masks the fact that many funds disappear each year, often as a result of poor investment performance.

The gray boxes in Exhibits 2.1 and 2.2 (next page) represent the number of US-domiciled equity and fixed income funds in operation during the past three, five, 10, and 15 years. These funds compose the beginning universe of each period. For example, an investor trying to select a mutual fund at the start of the three-year period (2012) could have chosen from 4,277 equity funds and 909 bond funds.

How many of the funds that began each period still existed at the end of 2014? The striped areas show the proportions that survived. During the three-year period, 85% of equity funds and 88% of fixed income

funds survived. Over time, fund survival rates dropped sharply. In equities, the five-, 10-, and 15-year survival rates were just 75%, 56%, and 42%, respectively. The numbers were only slightly better in fixed income, with 79% of funds making it five years, 57% surviving 10 years, and 41% surviving 15 years.

Investors may be surprised by how many mutual funds become obsolete over time. Funds tend to disappear quietly, and underperforming funds—especially those that do not survive and are no longer available for investment—receive little attention.

Non-surviving funds tend to be poor performers. Certainly, investors would like to identify obsolete funds in advance and avoid them. But the reality is that everyone must choose from a universe

4

Exhibit 2.1 Survivorship and Outperformance—Equity Funds

Performance periods ending December 31, 2014

Beginning sample includes funds as of the beginning of the three-, five-, 10-, and 15-year periods ending December 31, 2014. The number of beginners is indicated below the period label.

Survivors are funds that were still in existence as of December 31, 2014. Non-survivors include funds that were either liquidated or merged.

Outperformers (winners) are funds that survived and beat their respective benchmarks over the period.

Past performance is no guarantee of future results.

See Data appendix for more information.

that includes funds that will not survive the period, and an accurate depiction of the fund selection challenge requires performance data from both surviving and non-surviving funds.

Investors likely have a more ambitious goal than to just pick a fund that survives. Most people are on a hunt for funds that will outperform a benchmark. What were their chances of picking an outperforming, or “winning,” fund?

The blue and yellow areas show the proportion of equity and fixed income funds that outperformed their respective benchmarks. These funds are certainly in the minority. Over both short and longer time horizons—and for both equities and bonds—the deck is stacked against the investor seeking outperformance.

For example, only 31% of both equity and fixed income funds survived and outperformed their benchmarks for the three-year period ending December 31, 2014. Fund performance results are even worse over longer horizons. Less than one in four equity and fixed income funds survived to provide benchmark-beating performance over the five years through 2014. Over 15 years, the ratio dropped to one in five among equity funds and one in 12 among fixed income funds.

In the fiercely competitive mutual fund industry, many funds do not survive, but many more crop up to take their place. The free exit and entry supports a vast price discovery effort among managers, with the evidence suggesting reasonably fair market prices.

Outperformance is hard to come by. Only 19% of equity funds and 8% of fixed income funds survived and outperformed over the 15-year period through 2014.

Exhibit 2.2 Survivorship and Outperformance—Fixed Income Funds

Performance periods ending December 31, 2014

The search for winners

The competitive landscape makes the search for future winners a formidable challenge. Confronted with so many fund choices—and lacking an investment philosophy to inform their search—some investors may resort to using track records as a guide to selecting funds, reasoning that a manager’s past outperformance is likely to continue in the future.

Does this assumption pay off? The research offers evidence to the contrary.

Exhibits 3.1 and 3.2 (next page) illustrate the lack of persistence in outperformance. Three-, five-, and 10-year mutual fund track records are evaluated through the end of 2009, and funds that beat their respective benchmarks are re-evaluated in the subsequent five-year period ending December 31, 2014.

Only a small percentage of the beginning equity funds outperformed in the initial periods—and subsequent performance was not much better. For example, only 25% of the equity funds with past outperformance during the initial three-year period (2007–2009) continued to beat their benchmarks in the subsequent five-year period (2010–2014).

Finding past winners does little to help investors identify future outperforming funds. The results for equity funds with good five- and 10-year track records were similar—less than a third beat their benchmarks in the subsequent period.

The past returns of fixed income funds do not provide insight into future outperformance, either. The number of bond funds with good track records is sparse, with no more than 20%

6

Exhibit 3.1 Do Winners Keep Winning?—Equity Funds

Past performance vs. subsequent performance

The sample includes funds at the beginning of the three-, five-, and 10-year periods, ending in December 2009.

The graph shows the proportion of funds that outperformed and underperformed their respective benchmarks (i.e., winners and losers) during the initial periods.

Winning funds were re-evaluated in the subsequent period from 2010 through 2014, with the graph showing the proportion of outperformance and underperformance among past winners. (Fund counts and percentages may not correspond due to rounding.)

Past performance is no guarantee of future results.

See Data appendix for more information.

of the beginning funds showing benchmark-beating returns during the initial three-, five-, and 10-year performance periods.

Less than 40% of the three- and five-year past winners continued to outperform in the subsequent five years, and 52% of the 10-year winners outperformed.

The results for both winning equity and fixed income funds show that past outperformance is not a reliable indicator of future outperformance. Even past winners are likely to underperform in the future.

This lack of persistence among winners suggests that gaining a consistent informational advantage is very difficult. Many smart professionals are striving to gather morsels

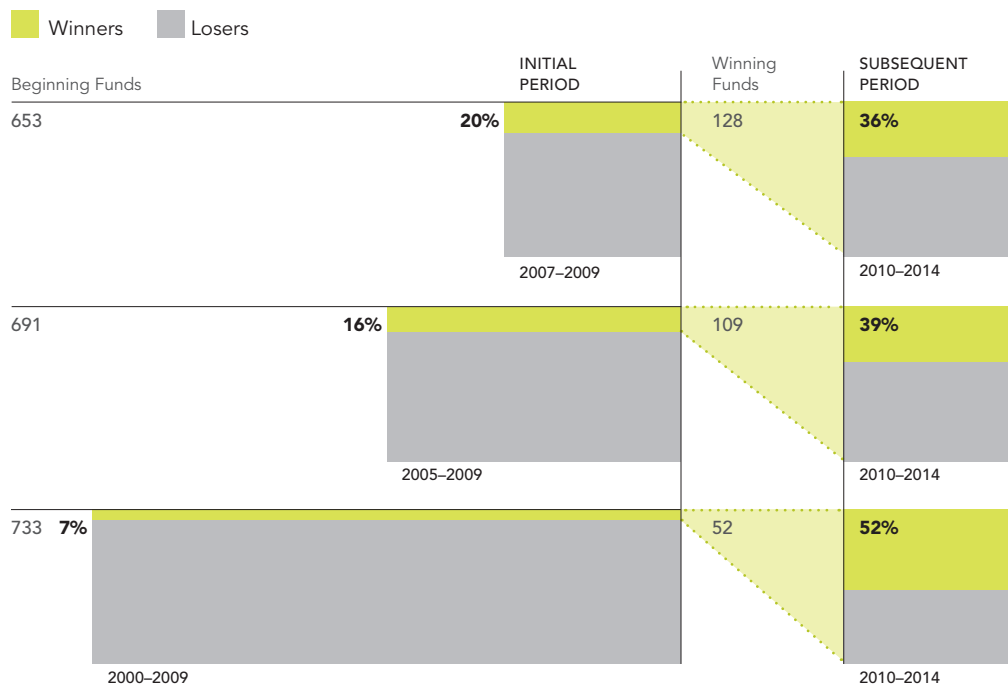

of information to help them identify pricing mistakes. But this competition means that public information is quickly reflected in market prices, leaving few opportunities to exploit the knowledge for profit.

Some fund managers might be better than others, but they are hard to identify in advance using track records alone. Stock and bond returns contain a lot of noise, and impressive track records often result from good luck. The assumption that past outperformance will continue often proves faulty, leaving many investors disappointed.

Many equity and fixed income funds, even past winners, are likely to underperform in the future.

Exhibit 3.2 Do Winners Keep Winning?—Fixed Income Funds

Past performance vs. subsequent performance

The impact of costs

If competition drives prices to fair value, one might wonder why underperformance is so common. A major factor is mutual fund costs. Costs reduce an investor's net return and represent a hurdle for a fund. To outperform, a fund must add enough value to exceed its costs.

All mutual funds incur costs. Some costs, such as expense ratios, are easily observed, while others, including trading costs, are more difficult to measure. The question is not whether investors must bear some costs, but whether the costs are reasonable and indicative of the value added by a fund manager's decisions.

The research shows that many mutual funds are expensive to own and do not offer higher value for the higher costs incurred. Let's consider how one type of explicit cost—expense ratios—can impact fund performance.

In Exhibits 4.1 and 4.2 (next page), equity and fixed income funds in existence at the beginning of the five-, 10-, and 15-year periods are ranked by quartiles based on their average expense ratio. The graph shows the percentage of winners (outperformers) and losers (underperformers) for each quartile across periods.

8

Exhibit 4.1 High Costs Make Outperformance Difficult—Equity Funds

Winners and losers based on expense ratios (%)

The sample includes funds at the beginning of the five-, 10-, and 15-year periods ending December 31, 2014.

Funds are ranked by quartiles based on average expense ratio over the sample period, and performance is compared to their respective benchmarks.

The chart shows the percentage of winner and loser funds within each expense ratio quartile.

Past performance is no guarantee of future results.

See Data appendix for more information.

Fund expense ratios range broadly across both equity and fixed income funds. For example, in the five-year period, equity funds in the lowest quartile cost investors an average of 0.51%. The most expensive quartile, at 1.68%, had an average cost that was more than three times higher. The range is just as wide in fixed income, with the lowest quartile charging 0.26% vs. 1.06% for the highest quartile during the five-year period.

Are investors receiving a better experience from higher-cost funds? The charts suggest otherwise.

Especially for longer horizons, the cost hurdle becomes too high for most funds to overcome.

Over 15 years, 29% of the lower-cost equity funds outperformed, compared to only 9% of the higher-cost equity funds. Similarly, for fixed income, only 11% of the lower-cost funds and 2% of the higher-cost funds outperformed.

The research suggests that high fees can contribute to underperformance. The higher a fund's costs, the higher its return must be to stay competitive. Investors may be able to reduce the odds of picking a persistent loser by avoiding funds with high expense ratios.

The higher a fund's costs, the higher its return must be to stay competitive. Investors may be able to reduce the odds of picking a persistent loser by avoiding funds with high expense ratios.

Exhibit 4.2 High Costs Make Outperformance Difficult—Fixed Income Funds

Winners and losers based on expense ratios (%)

The impact of costly turnover

Excessive turnover creates high trading costs that can detract from returns.

Other activities can add substantially to a mutual fund’s overall cost burden. Equity trading costs, such as brokerage fees, bid-ask spreads,¹ and price impact, can be just as large as a fund’s expense ratio. Trading costs are difficult to observe and measure, but they impact a fund’s return nonetheless—and the higher these costs, the higher the outperformance hurdle.

Among equity funds, portfolio turnover can offer a rough proxy for trading costs.² Managers who trade frequently in their attempts to add value typically incur greater turnover and higher trading costs. Although turnover is just one way to approximate trading costs, the study indicates that funds with higher turnover are more likely to underperform their benchmarks.

In Exhibit 5, equity funds existing at the beginning of the five-, 10-, and 15-year periods are placed in quartiles based on their average turnover. Turnover varies dramatically across equity funds, reflecting many different management styles. For the most recent five-year period, funds in the low-turnover quartile averaged 17% turnover. The average turnover for the highest quartile was 185%, more than 10 times higher.

Funds with high turnover have lower rates of outperformance. For the five-year period, 33% of funds in the lowest quartile beat their benchmarks, while only 20% in the high-turnover quartile had winning performance. The principle also applies to 10- and 15-year periods, with fewer winners among the high-turnover quartiles.

Exhibit 5 High Trading Costs Make Outperformance Difficult—Equity Funds

Winners and losers based on turnover (%)

The sample includes equity funds at the beginning of the five-, 10-, and 15-year periods ending December 31, 2014.

Funds are ranked by quartiles based on average turnover during the sample period, and performance is compared to their respective benchmarks.

The chart shows the percentage of winner and loser funds within each turnover quartile.

SUMMARY

This analysis of US mutual fund performance illustrates the obstacles confronting investors seeking outperforming funds.

For the periods examined, the research shows that:

- **Outperforming funds were in the minority.**
- **Strong track records failed to persist.**
- **High costs and excessive turnover may have contributed to underperformance.**

These results are consistent with a market equilibrium view of investing. Intense market competition drives securities prices to fair value, making it difficult to persistently add value by identifying mispriced securities. Despite the best efforts of many professionals working in the industry, the vast majority of funds fail to outperform their benchmarks.

Although the odds are stacked against them, many investors continue searching for winning mutual funds and look to past performance as the main criterion for evaluating a manager's future potential. In their pursuit of returns, many investors surrender performance to high fees, high turnover, and other costs of owning the mutual funds.

The underperformance of most US mutual funds highlights an important investment principle: The capital markets do a good job of pricing securities, which makes beating benchmarks (and other investors) quite difficult. When fund managers charge high fees and trade frequently, they must overcome high cost barriers as they try to outperform the market.

Choosing a long-term winner involves more than seeking out funds with a successful track record, as past performance offers no guarantee of a successful investment outcome in the future. Moreover, finding past performance is only one way to evaluate a manager.

Investors should consider other variables, including a mutual fund's underlying market philosophy, investment objectives, and strategy. They should also consider a mutual fund's total costs, including trading costs, which may be affected by the manager's approach.

Data appendix

US-domiciled mutual fund data is from the CRSP Survivor-Bias-Free US Mutual Fund Database, provided by the Center for Research in Security Prices, University of Chicago.

Certain types of equity and fixed income funds were excluded from the performance study. For equities, sector funds and funds with a narrow investment focus, such as real estate and gold, were excluded. Money market funds, municipal bond funds, and asset-backed security funds were excluded from fixed income.

Funds are identified using Lipper fund classification codes. Correlation coefficients are computed for each fund with respect to diversified benchmark indices using all return data available between January 1, 2000, and December 31, 2014. The index most highly correlated with a fund is assigned as its benchmark. Winner funds are those whose cumulative return over the period exceeded that of their respective benchmark. Loser funds are funds that did not survive the period or whose cumulative return did not exceed their respective benchmark.

Expense ratio ranges: The ranges of expense ratios for equity funds over the five-, 10-, and 15-year periods are 0.01% to 4.89%, 0.01% to 4.53%, and 0.04% to 4.83%, respectively. For fixed income funds, ranges over the same periods are 0.01% to 2.78%, 0.05% to 2.55%, and 0.03% to 3.66%, respectively.

Portfolio turnover ranges: Ranges for equity fund turnover over the five-, 10-, and 15-year periods are 1.0% to 1,499.4%, 1.0% to 1,524.0%, and 2.0% to 2,400.4%, respectively.

Merrill Lynch, Pierce, Fenner & Smith Incorporated is a wholly owned subsidiary of Bank of America Corporation. The S&P data is provided by Standard & Poor's Index Services Group.

Benchmark indices are not available for direct investment. Their performance does not reflect the expenses associated with the management of an actual portfolio.

ENDNOTES

1. Bid-ask spread is the difference between the highest price a buyer is willing to pay for an asset and the lowest price for which a seller is willing to sell it.
2. Fixed income funds are excluded from the analysis because turnover is not a good proxy for fixed income trading costs.
